
Regenerated runs: runs/gate1a/numpy and runs/gate1a/cleanrl, seeds 1-10, 500,000 environment steps each; episodic returns are logged with exploration on, per D029. Thresholds T, F and delta from docs/gate1a_calibration.json. Panel A bins episodes by the step at which they ended (5,000-step bins, no interpolation); the interval is 10,000 bootstrap resamples of the 10 runs (Agarwal et al. 2021).
